AB - J05140419 The compsn. comprises a curing agent and an inorganic ion-exchange material blended with an epoxy resin.

- ADVANTAGE - The compsn. improves poor insulation caused by electrolytic corrosion or CAF.

- In an example, a 50 g of 1:1 mixed solvent of DMF and methylcellosolve with 2.0 g of dicyandiamide in advance was added to 100 g of bisphenol A-type bromided epoxy resin, 0.1 g of 2-ethyl imidazole was mixed, an 3 g of inorganic ion exchange material of "IXE-300" (RTM) was added and dispersed to form a varnish. The varnish was impregnated in a 0.1 mm thick cloth, dried for 5 minutes at 150 deg. C to form a prepreg, 8 of the prepregs were laminated, sandwiched by 18 microns thick Cu foils, press moulded by 40 kg/sq.cm of pressure at 170 deg. C for 90 minutes to form a 0.8 micron thick Cu cladde laminate having improved character(Dwg.0/1)
